Four advantages of Hot-Wind Rotary Circulation

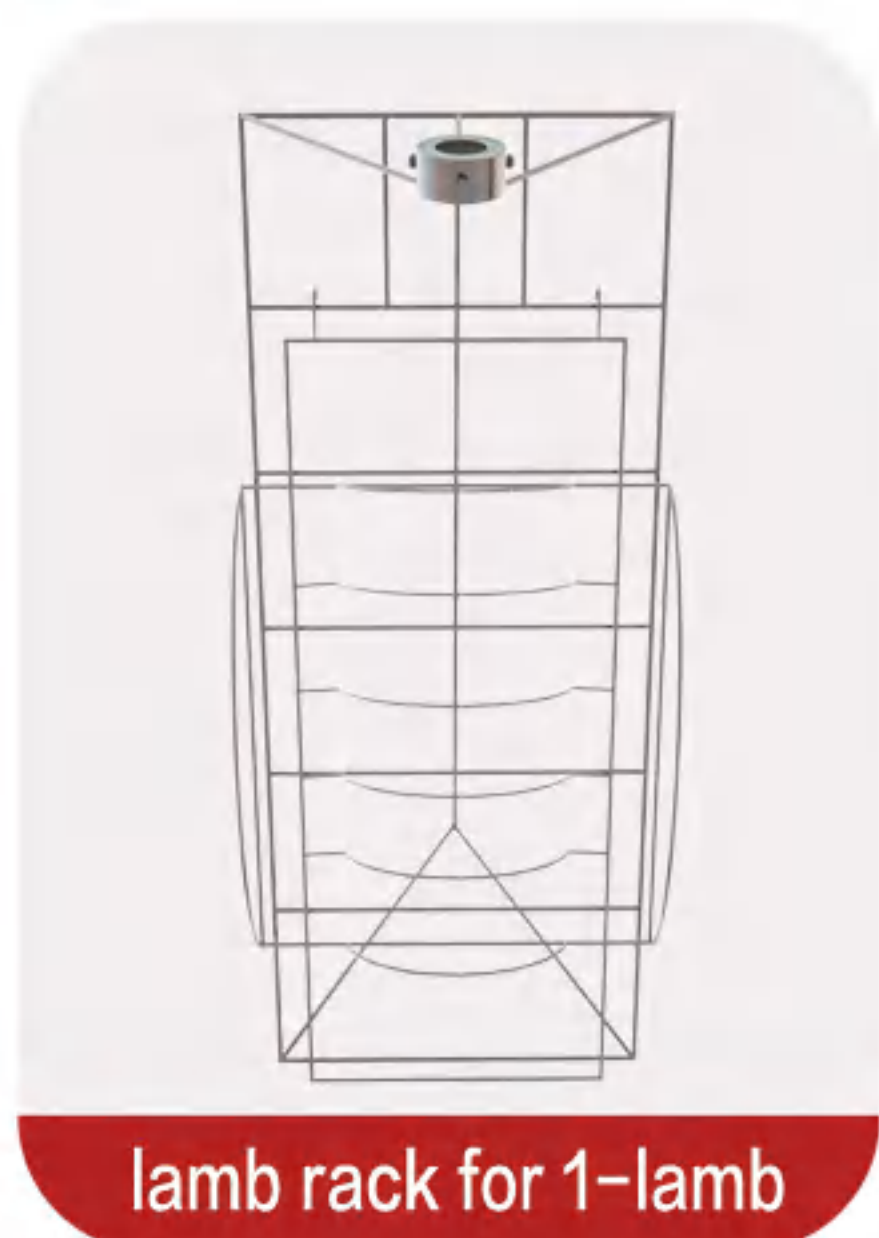

Hot-Wind Rotary Circulation system adopts two blower fans and heaters to generate circulatory air for roasting, which is uniform and efficient. Air source is driven by fan motors, then through the heater and sent to inner chamber of the roaster; the used air is sucked into air duct to become the new air source and being heated for re-circulation to ensure indoor temperature uniformity. Any action of door opening occurs, Rotary circulation system will stop to protect of human-beings.

- Rotary roasting
- Intelligent numerical control
- High-quality
- Energy saving and low consumption
